Getting started · 1. What the Cypher Scanner is

Getting started

01 What the Cypher Scanner is

The Cypher Scanner reads the chart on several layers at once: trend, momentum, reaction levels and volatility. When enough of those layers agree on the same candle, a clear signal prints on the screen. A gr… buy, a purple S… sell. You do not read indicators, you read the result.

up, and to wait when they do not.

ONE SYSTEM

Trend, momentum, levels and volatility read together, so you are not juggling a dozen indicators.

EVERY MARKET

Forex, gold, indices and crypto. The scanner adapts its levels to whatever you load.

ANY TIMEFRAME

From scalping the 5m to swinging the daily, the reads are the same. You pick the clock.

02 Who it is for, and when to use it

Cypher was built for two kinds of trader: the one starting out who wants the chart to make sense, and the one who already trades and wants cleaner setups with less screen time.

NEW TRADERS

Everything is colour coded and labelled. Green means up, purple means down, a letter on the candle means it is time. Learn a handful of reads and you can follow along from day one.

EXPERIENCED TRADERS

Use it as a confirmation layer. Filter setups, time entries more precisely, and read multi-timeframe context at a glance.

It also adapts to whatever the market is doing right now.

TRENDING

Price is moving with momentum. Cypher highlights pullbacks and continuation entries so you join the trend instead of chasing it.

RANGING

Price is stuck between two levels. Cypher marks the top and bottom so you can fade the edges rather than guess.

PULLING BACK

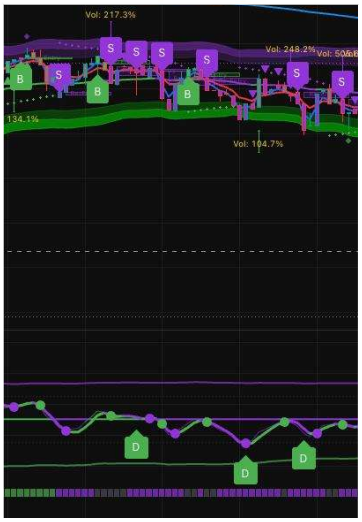

A strong trend retraces into the inner band. These are the cleanest entries, and Cypher flags the re-entry.

PULLING BACK

03 Markets and timeframes

Cypher works across every major asset class and adapts its reaction levels automatically. You do not change settings between gold and indices, or between forex and crypto. One tool, every market.

FOREX

Majors, crosses and emerging-market pairs. Low-priced and high-priced pairs alike.

GOLD AND METALS

Spot gold, silver and other metals get their own tuning for higher-priced assets.

INDICES

S&P, Nasdaq, Dow and the rest. Wider reaction levels suit how indices move.

CRYPTO

Bitcoin, Ethereum and the large-cap alts, using the wider levels that suit crypto volatility.

WHERE TO START

Begin with Gold (XAU/USD), NAS100 and US30 on the 15m, 1h and 4h. They give the cleanest reads. Once you are comfortable, add more pairs and timeframes from there.

Any style works. Scalpers read the short timeframes the same way as the long ones. Day traders sit in the sweet spot on the 15m to 1h. Swing traders take fewer, larger setups on the

What is on the chart

04 The Flag: your signal

The Flag is the main trigger. It is the moment the system's reads agree on the same candle. When that happens, a single letter prints: a green B for buy, a purple S for sell, on the candle it happens.

Behind the letter, three things line up on the same candle: the fast trend lines cross, the candle closes in the trade's direction, and the underlying flow at the bottom of the chart is not pointing the other way. The instant those agree, the Flag prints. You do not track any of it. You wait for the letter.

> The Flag sits just off the candle, the buy below and the sell above, so it never hides behind price. It fires once when a fresh setup lines up, rather than repeating while a single move plays out.

05 Reversal Bands

Cypher draws adaptive bands that move with volatility and mark where price is most likely to turn.

> Inner band: the first level of support and resistance, where pullbacks tend to end.
>
> Outer band: the high-probability reversal zone, where the bigger turns happen.

The space between the bands is tinted green or purple so you can see at a glance which side you are on. The strongest entries happen where price reacts to a band and the rest of the system agrees.

06 Key Levels

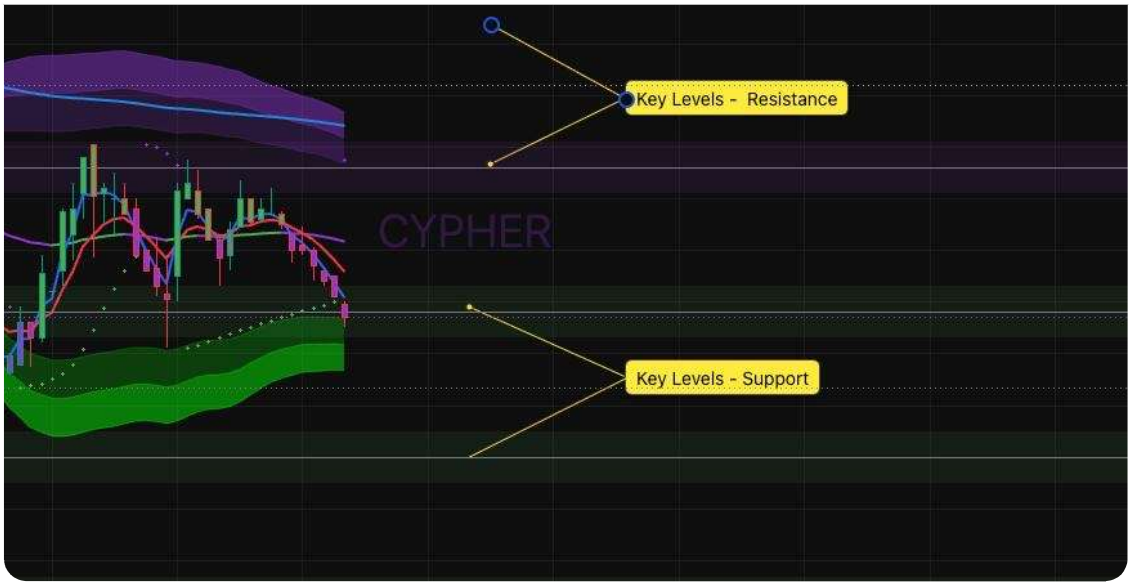

Cypher draws the round-number price levels that large players reference for orders. They form zones of support and resistance you can see coming well in advance.

- Red zones above price act as resistance.
- Blue zones below price act as support.
- Grey lines mark the levels, with a coloured glow showing which side of price they sit.

The spacing adapts to your timeframe and market. When a band touch lines up with a key level, the odds of a clean reaction go up.

Active · Bronze

07 Pivots and Fair Value Gaps

Pivots are well-known reaction zones calculated from the previous session. They add a third layer of support and resistance.

Green lines below price are the support pivots.

Purple lines above price are the resistance pivots.

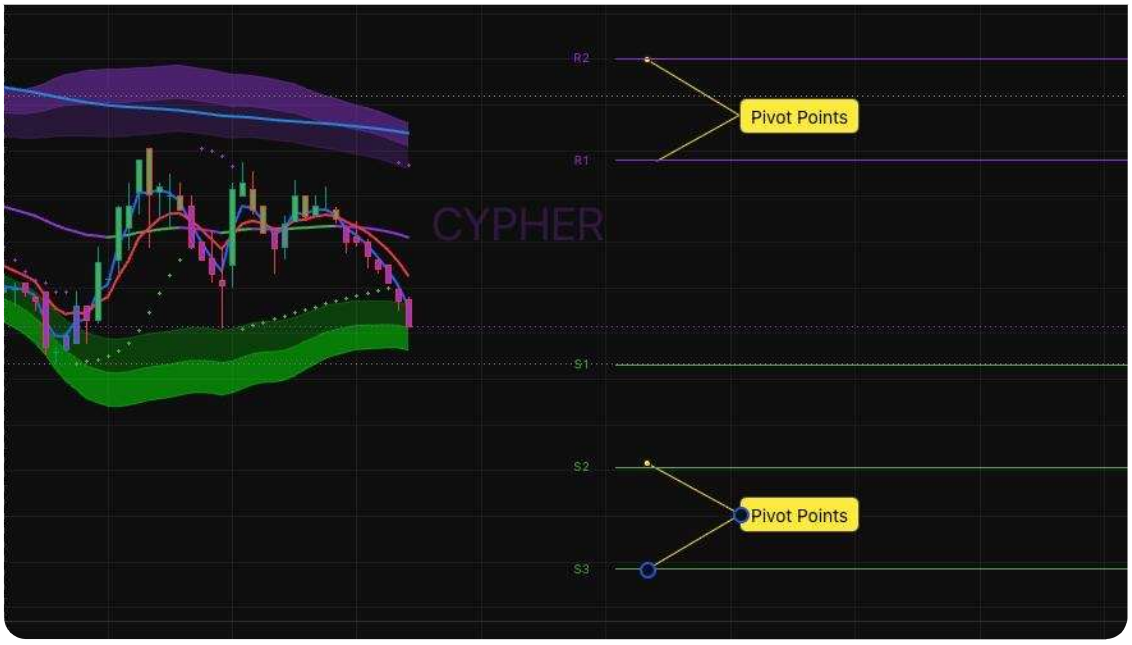

Inner pivots are nearby targets. Outer pivots are extreme stretch zones.

FAIR VALUE GAPS

On the 15m and above, Cypher marks Fair Value Gaps as translucent boxes: imbalances left behind when price moves too fast. Markets tend to come back and fill them, so an unfilled gap becomes a target area.

08 Trend Table

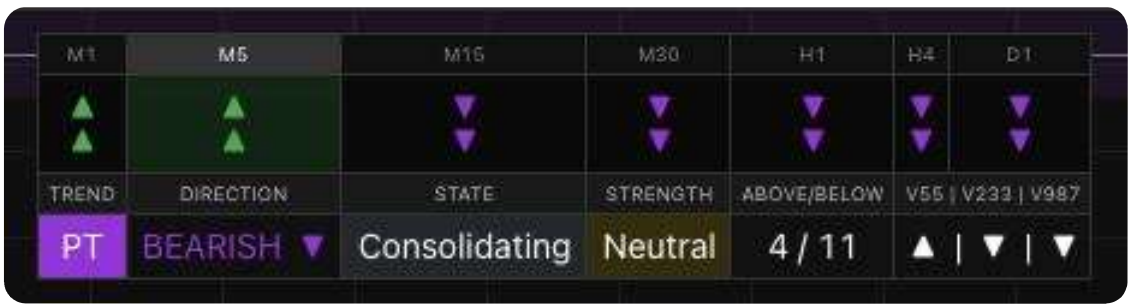

The Trend Table sits in the top-right corner and reads the market on several timeframes at once, so you can see which way each layer points in a single glance.

One row per timeframe.

Green means that timeframe is bullish, purple means bearish.

Your current timeframe is highlighted, so you always know where you sit.

Each column reads from that timeframe's own last closed candle, so a column shows the same thing no matter which chart you are on. The most useful read is your trading timeframe against the one above it. When both agree, you have the wind behind you.

09 The Pulse Line

12 99 Active · Bronze

DIRECTION

Is it pointing the same way as your trade? Up for buys, down for sells. The basic check.

SECONDARY-SIGNAL CROSS

A large dot prints when momentum hands over. One of the strongest early cues.

THE "D" DIVERGENCE LABEL

When the Pulse Line moves the opposite way to price, a D prints. The strongest reversal cue Cypher gives.

BAR COLOUR AT THE BOTTOM

A row of bars shows the underlying bias. Green bullish, purple bearish, grey mixed.

10 Bar colour and arrows

Three smaller features sit on the candles and quietly do a lot of the work.

BAR COLOUR

Every candle is outlined by the underlying read. Green is bullish flow, purple is bearish, grey is mixed or waiting. This is one of the conditions behind the Flag.

SNIPER ARROWS

Small arrows for quick continuation entries inside a strong trend. Handy for adding to winners or taking pullback re-entries.

BREAK ARROWS

Larger arrows when price breaks a recent swing with volume behind it, labelled with the volume strength.

12 99

Active · Bronze

Almost every Cypher trade is one of three types. Knowing which one you are in tells you what to confirm and what to ignore.

THE RANGE

Price is moving sideways between a top and a bottom. Trade the bounces and fade the extremes.

THE TREND

Price is moving one way. Wait for a pullback to the inner band, then enter on the continuation when the Flag fires.

THE REVERSAL

Price has run into a major band and momentum is exhausted. Catch the turn as the Flag fires the other way.

12 The five-rule routine

Whichever setup you are in, the routine is the same. Run through it in order. If a rule fails, you skip the trade. If they all pass, you take it.

1. Setup
   Identify which of the three setups is in front of you. The bands and the Trend Table do most of that work for you.
2. The Flag
   Wait for the letter. No B or S, no trade. This is the moment the system tells you the pieces line up, and it anchors every other check.
3. Pulse Line
   Confirm momentum agrees: its direction, a secondary-signal cross, or a fresh divergence D.
4. Zone
   Make sure price is at a meaningful zone: a reversal band, a key level, a pivot, or an unfilled gap. Two lining up is good, three is excellent.
5. Risk to reward
   Read the entry, stop and targets on the chart, place the trade with proper risk to reward, then manage to plan.

13 Your trade plan: entry, stop, targets

Entry

The price marked at the Flag candle. Enter at market, or wait for a small pullback into it for a tighter stop.

Stop loss

Sits at the most recent swing: the swing low for a buy, the swing high for a sell. If price closes through it, the read is invalid and you exit.

Take profits

TP1, TP2 and TP3 sit at one, two and three times the distance from your entry to the stop. The same clean risk to reward on every market.

MANAGING THE TRADE

A common approach is to take part off at TP1, more at TP2, and trail the rest toward TP3. Moving your stop to entry once TP1 is hit protects the trade. If the bar colour flips against you before TP2, take the rest off at market.

14 Quick answers

Do I have to watch all of this?

No. Wait for the letter. Everything else is context that makes a signal stronger or weaker.

How many signals will I get?

It depends on the pair and timeframe. The 15m, 1h and 4h give fewer, cleaner reads than the very low timeframes.

What if two timeframes disagree?

Stand down, or wait for them to line up. The best trade is sometimes no trade.

Where do the entry, stop and targets come from?

They are drawn for you automatically the moment the Flag fires.

Can I use it on any market?

Yes. Cypher adapts its levels to forex, gold, indices and crypto without changing settings.
